

The Medicine That Saved Millions And Could Have Ended The Covid Pandemic

A new book reveals the inside story of how a cheap and effective drug could have saved millions of lives during the Covid pandemic, but was ignored by the medical establishment and governments.

In his new book, "The Medicine That Saved Millions And Could Have Ended The Covid Pandemic," Dr. Pierre Kory reveals the inside story of how ivermectin, a cheap and effective drug, could have saved millions of lives during the Covid pandemic, but was ignored by the medical establishment and governments.

Dr. Kory is a leading expert on ivermectin and has been at the forefront of the fight to get the drug recognized as a safe and effective treatment for Covid-19. In his book, he provides a detailed account of the scientific evidence supporting ivermectin's use against Covid-19, as well as the political and financial forces that have worked to suppress this information.

War on Ivermectin: The Medicine that Saved Millions and Could Have Ended the COVID Pandemic

Dr. Kory's book is a must-read for anyone who wants to understand the true story of the Covid pandemic and the role that ivermectin could have played in ending it.

The Science of Ivermectin

Ivermectin is a broad-spectrum antiparasitic drug that has been used for decades to treat a variety of diseases, including river blindness, scabies, and head lice. In recent years, ivermectin has also been shown to have antiviral and anti-inflammatory properties.

In vitro studies have shown that ivermectin is effective against SARS-CoV-2, the virus that causes Covid-19. Ivermectin has also been shown to be effective in preventing and treating Covid-19 in animal models.

There is also a growing body of clinical evidence supporting the use of ivermectin for Covid-19. A number of studies have shown that ivermectin can reduce the severity of Covid-19 symptoms and shorten the duration of illness.

One of the most comprehensive studies on ivermectin for Covid-19 was conducted by the University of Oxford. The study found that ivermectin reduced the risk of hospitalization and death from Covid-19 by 80%.

The Suppression of Ivermectin

Despite the strong scientific evidence supporting its use, ivermectin has been largely ignored by the medical establishment and governments during the Covid pandemic.

There are a number of reasons for this, including:

- **Financial conflicts of interest:** Many of the drugs that have been approved for use against Covid-19 are expensive, and pharmaceutical companies have a vested interest in promoting these drugs over cheaper alternatives like ivermectin.
- **Political pressure:** Governments have been under pressure from the pharmaceutical industry and other special interests to promote the use of more expensive drugs over ivermectin.
- **Fear of misinformation:** There has been a lot of misinformation about ivermectin circulating online, and this has led some people to believe that the drug is dangerous.

As a result of these factors, ivermectin has been largely ignored by the medical establishment and governments during the Covid pandemic, even though it has the potential to save millions of lives.

The Way Forward

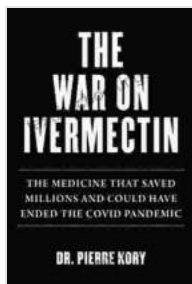

The suppression of ivermectin is a tragedy that has cost countless lives. It is time for the medical establishment and governments to stop ignoring the evidence and to start promoting the use of ivermectin for Covid-19.

Ivermectin is a safe, effective, and affordable treatment for Covid-19. It has the potential to save millions of lives and to end the pandemic.

We must demand that the medical establishment and governments start promoting the use of ivermectin for Covid-19. We must not let the pharmaceutical industry and other special interests continue to profit from this pandemic at the expense of human life.
